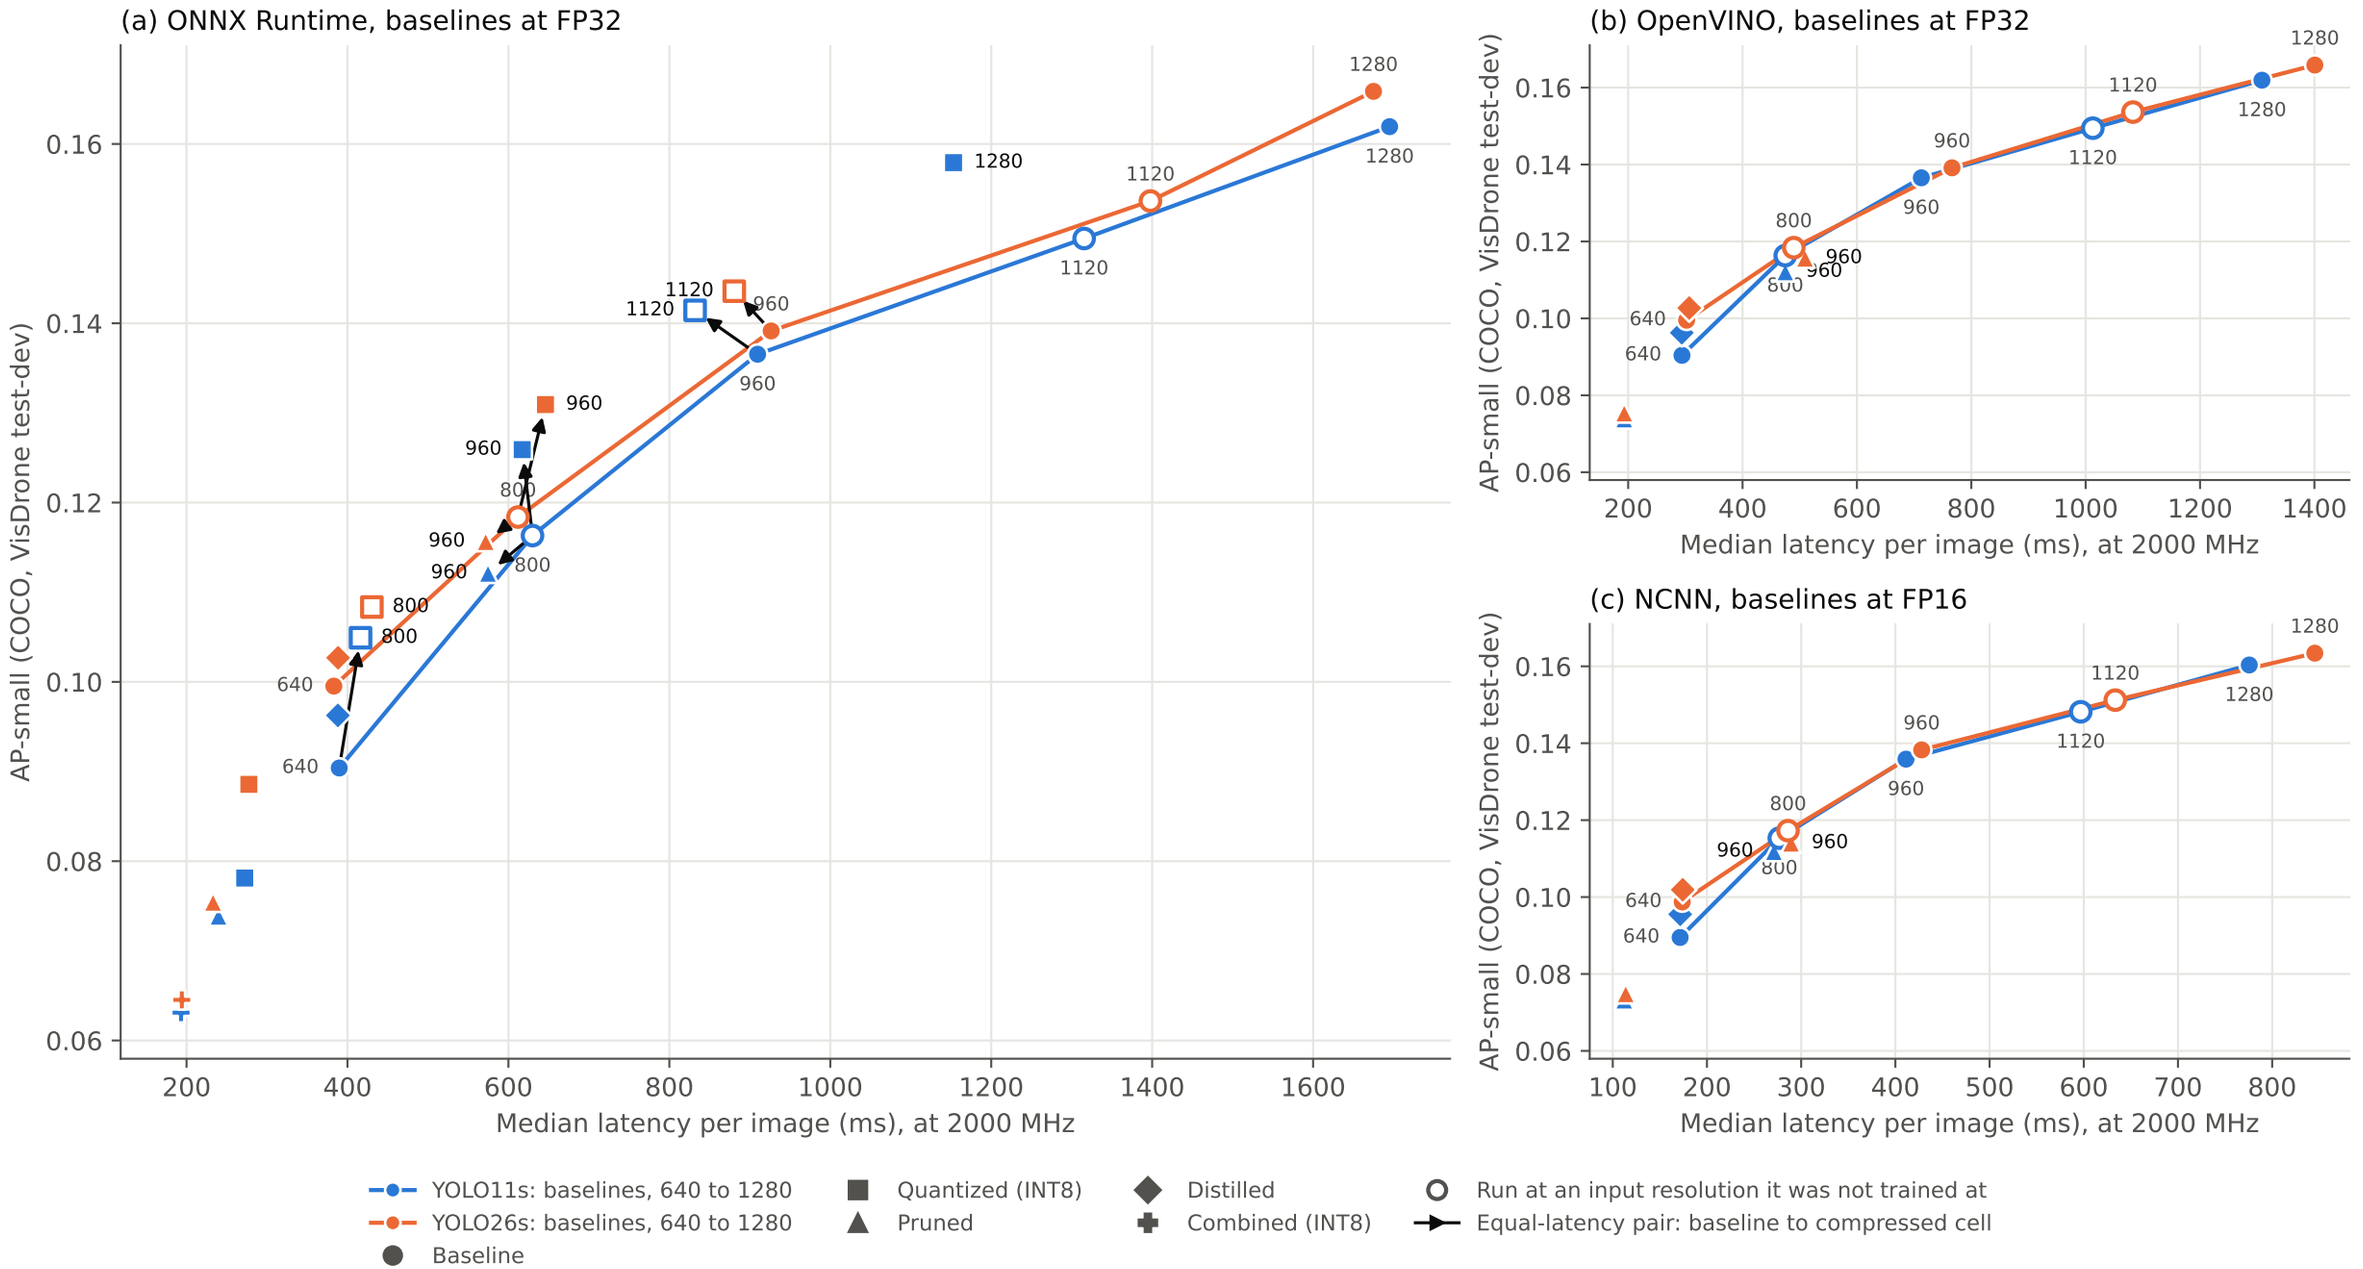
AP-small against latency on the Pi 5: compression spent on input resolution


Numbers: input resolution; a compressed cell with none is at 640. Arrow: a compressed cell at a larger input resolution within 10 % of a baseline's median latency
(the headline pairs: INT8 is per-channel). One-to-many head. The baselines at 1120 are session 6's, whose latencies are about 6 % high; the INT8 cells at 1120 are session 7's.
